1. There could be several problems. The big one that stands out to me is, what if the hard drive the program is running on is bigger than the data file being imported? Also the upload time could be so long that the user thinks the program crashed.
2. There was Amanda and amanda used in the name field.
3. The prices were uploaded as strings, and needed to be converted into an a strickly number data type before you could do any calculations.
4. 26 records
5. There was a new row added called Region. In my file IO, it was trying to read in date created dates but instead was reading in strings from Name.
